

## pearlbritecanada™ professional teeth whitening

### **How long does it last?**

Your bright smile will last from 6 months to 2 years depending on your after care and oral habits.

### **Is the procedure done by a dentist?**

No, this process is provided by certified professionals.

### **Is the PearlBrite process safe?**

Research has shown if the teeth and gums are healthy there are no adverse affects. People with tooth decay or any type of gum disease should avoid this procedure. We do not treat people who are photosensitive or on any photosensitive drugs (tetracycline or minocycline). We do not treat pregnant women or those 16 years of age and under. There are no known side affects; however, it is a precaution.

### **What if I have crowns, fillings, and veneers?**

The professional procedure will whiten your crowns, fillings, and veneers to their original shade. Your natural teeth may whiten to their original shade. If you are planning on enhancements to your teeth we recommend you have your teeth whitened 2 weeks before your dental treatments.

### **Will the procedure be the same as from my dentist?**

Yes, our partner in the whitening industry supplies the same products to dentists. The key to the success of our whitening system is our patented blue light technology which increases the potency of whitening in a fraction of the time and cost.

### **What do you recommend for after care?**

We recommend use of the **PearlBrite Shine Touch-Up Pen** as daily maintenance after eating and drinking. Our PearlBrite **Organic AM & PM Shine Sprays** will prolong your brighter smile. Remember, if it stains a white T-shirt, it will stain your teeth.

### **How much does it cost?**

\$150 plus GST.

### **Who benefits from the PearlBrite system?**

Almost everyone can enjoy the benefit of the bleaching process if their teeth and gums are healthy. Remember, teeth cannot be bleached whiter than genetically possible. Tetracycline stains cannot be removed. Limited results should be expected on stains resulting from excessive fluoride use.

### **How many treatments?**

We guarantee 2 to 10 shades whiter in one 20 minute treatment. Shade differences will vary depending on your start shade.

### **How long does it take?**

The procedure takes 20 minutes.

### **Is it painful?**

Some people feel a slight tingling sensation, white gum line, or minor sensitivity. All of which are normal and of no real danger.

### **How does it work?**

We use a patented one size fits all mouthpiece with foam strips impregnated with a special whitening gel and a patented spectrum blue LED (ADT-1500SP). This formula forces activation of the gel. Hydrogen peroxide breaks down into water molecules and free oxygen radicals. The oxygen radicals combined with carbon-based molecules in stained teeth remove the discoloration and brighten your smile. This process penetrates the tooth enamel to the dentin, but will not damage the enamel.
